📦 /usr/local/Cellar/nghttp2/1.43.0: 24 files, 2.8MB
==> Installing curl
==> Pouring curl-7.75.0.big_sur.bottle.tar.gz
==> Caveats
curl is keg-only, which means it was not symlinked into /usr/local,
because macOS already provides this software and installing another version in
parallel can cause all kinds of trouble.

If you need to have curl first in your PATH, run:
  echo 'export PATH="/usr/local/opt/curl/bin:$PATH"' >> ~/.zshrc

For compilers to find curl you may need to set:
  export LDFLAGS="-L/usr/local/opt/curl/lib"
  export CPPFLAGS="-I/usr/local/opt/curl/include"

zsh completions have been installed to:
  /usr/local/opt/curl/share/zsh/site-functions
==> Summary
📦 /usr/local/Cellar/curl/7.75.0: 480 files, 3.7MB
Removing: /usr/local/Cellar/curl/7.74.0... (479 files, 3.7MB)
Removing: /Users/jasonjames/Library/Caches/Homebrew/curl--7.74.0.big_sur.bottle.2.tar.gz... (1.2MB)
